IN THE CLAIMS:

Please cancel claims 2, 17 and 32.

Please amend claims 1, and 3-8 as follows:

1. (Currently Amended) A method for managing a scheduling system, comprising the steps of:

receiving information about an appointment from a user;

receiving information about an attendee associated with the appointment, including attendee notification information;

determining meeting status information;

automatically generating an attendee notification message using the attendee notification information based on the meeting status information; and

receiving a response to the attendee notification message from an attendee, the response changing the time of the appointment, wherein the meeting status information indicates if the user will be late for the appointment, said step of automatically generting an attendee notification message is performed when the meeting status indication information indicates that the user will be late for the appointment.

2. (Canceled).

3. (Currently Amended) The method of claim [[2]] 1, wherein the attendee notification information is a telephone number and said step of generating is performed by generating an audio message.

4. (Currently Amended) The method of claim [[2]] 1, wherein the attendee notification information is an electronic mail address and said step of generating is performed by generating an electronic mail message.

5. (Currently Amended) The method of claim [[2]] 1, wherein said step of determining is based on information received from a computer through a communication network.

6. (Currently Amended) The method of claim [[2]] 1, wherein said step of determining is based on information received from a telephone through a communication network.

7. (Currently Amended) The method of claim [[2]] 1, wherein said step of determining is based on information received from a wireless device through a communications network.

8. (Currently Amended) The method of claim [[2]] 1, wherein the information about the appointment includes appointment time information and appointment location information, and wherein said step of determining comprises:

receiving user location information; and

deciding if the user will be late for the appointment based on the appointment time information, the appointment location information, the user location information and a time associated with the user location information.

9. (Previously Presented) The method of claim 8, wherein said step of deciding comprises:

calculating a travel distance based on the appointment location information and the user location information;

calculating a time of arrival based on the time associated with the user location information, the travel distance and a travel velocity; and

comparing the calculated time of arrival with the appointment time information.

10. (Previously Presented) The method of claim 9, further comprising the steps of:

receiving map information from a mapping database; and

adjusting the travel distance based on the appointment location information, the user location information, and the map information.

11. (Previously Presented) The method claim 9, further comprising the steps of:

receiving environment information; and

adjusting the travel velocity based on the environment information.

12. (Previously Presented) The method of claim 5 wherein said steps of receiving can be performed from multiple access devices.

13. (Previously Presented) The method of claim 2, further comprising the step of:

sending the attendee notification message to the attendee.

14. (Previously Presented) The method of claim 13, wherein the response received from the attendee to the attendee notification message changes the information about the appointment.

15. (Previously Presented) The method of claim 9, wherein said step of comparing is performed by comparing the calculated time of arrival with the appointment time information and a predetermined fixed period of time.

16. (Previously Presented) A scheduling system, comprising:

a scheduler database for storing information about an appointment and information about an attendee associated with the appointment, including attendee notification information; and

a scheduling unit coupled to said scheduler database and configured to determine if a user will be late for the appointment, said scheduling unit being further configured to (i) send an attendee notification message to the attendee using the attendee notification information when the user will be late for the appointment, and (ii) receive a response from the attendee to the attendee notification message, the response changing the time of the appointment .

17. (Canceled).

18. (Previously Presented) An article of manufacture comprising a computer-readable medium having stored thereon instructions adapted to be executed by a processor, the instructions which, when executed, define a series of steps to manage a scheduling system, cause a series of steps to be performed, said steps comprising:

receiving information about an appointment from a user;

receiving information about an attendee associated with the appointment, including attendee notification information;

determining if the user will be late for the appointment;

sending an attendee notification message to the attendee using the attendee notification information when the user will be late for the appointment, and

receiving a response from the attendee to the attendee notification message, the response changing the time of the appointment.

19. (Previously Presented) A method for managing a scheduling system, comprising the steps of:

receiving information about an appointment, including appointment time information and appointment location information, from a user;

receiving user location information;

determining if the user will be late for the appointment based on the user location information, the appointment location information, the appointment time information and a time associated with the user location information; and

receiving a response from an attendee of the appointment, the response changing the time of the appointment.

20. (Previously Presented) The method of claim 19, wherein said step of determining comprises the steps of:

calculating a travel distance between the appointment location and the user location based on the appointment location information and the user location information;

calculating a time of arrival based on the time associated with the user location information, the travel distance and a travel velocity; and

comparing the calculated time of arrival with the appointment time information.

21. (Previously Presented) The method of claim 19, wherein the user location information is generated by a global positioning satellite receiver.

22. (Previously Presented) The method of claim 19, wherein the user location information is calculated from an automatic number identification number.

23. (Previously Presented) The method of claim 19, wherein the user location information is received through a communication network.

24. (Previously Presented) The method of claim 20, further comprising the steps of:

receiving map information from a mapping database; and

adjusting the travel distance based on the appointment location information, the user location information, and the map information.

25. (Previously Presented) The method claim 20, further comprising the steps of:

receiving environment information; and

adjusting the travel velocity based on the environment information.

26. (Previously Presented) The method of claim 25, wherein the environment information is weather information.

27. (Previously Presented) The method of claim 25, wherein the environment information is traffic information.

28. (Previously Presented) The method of claim 25, wherein the environment information is airline information.

29. (Previously Presented) A scheduling system, comprising:

a scheduler database for storing information about an appointment, including appointment time information and appointment location information;

location determination unit configured to output user location information; and

a scheduling unit coupled to said scheduler database and said location determination unit, said scheduling unit being configured to (i) determine if a user will be late for the appointment based on the user location information, the appointment location information, the appointment time information and a time associated with the user location information (ii) receive a response

from an attendee of the appointment, the response changing the time of the appointment.

30. (Previously Presented) An apparatus to manage a scheduling system, comprising:

means for receiving information about an appointment, including appointment time information and appointment location information, from a user;

means for receiving user location information;

means for determining if the user will be late for the appointment based on the user location information, the appointment location information, the appointment time information and a time associated with the user location information; and

means for receiving a response from an attendee of the meeting, the response changing the time of the appointment.

31. (Previously Presented) An article of manufacture comprising a computer-readable medium having stored thereon instructions adapted to be executed by a processor, the instructions which, when executed, define a series of steps to manage a scheduling system, said steps comprising:

receiving information about an appointment, including appointment time information and appointment location information, from a user;

receiving user location information;

determining if the user will be late for the appointment based on the user location information, the appointment location information, the appointment time information and a time associated with the user location information; and

receiving a response from an attendee of the appointment, the response changing the time of the appointment, if it is determined that the user will be late for the appointment.

32. (Canceled).

33. (Previously Presented) The method of claim 1 wherein the response from the attendee can be received by page, facsimile or e-mail.

34. (Previously Presented) An article of manufacture comprising a computer-readable medium having stored thereon instructions adapted to be executed by a processor, the instructions which, when executed, define a series of steps to manage a scheduling system, said steps comprising:

receiving information about an appointment, including appointment time information and appointment location information, from a user;

receiving user location information;

determining if the user will be late for the appointment based on the user location information, the appointment location information, the appointment time information and a time associated with the user location information;

notifying an attendee of the appointment, if it is determined that the user will be late for the appointment; and

receiving a response from the attendee, the response including a proposal for a new time for the appointment.

35. (Previously Presented) The method of claim 34 wherein the recited steps are performed by a PDA.
